Solutions for Enterprise Networks

Everything your Network needs

3M Enterprise Network Solutions offer an array of high performance solutions for copper, fibre and copper/fibre hybrid networks.

Global training and product support from a supplier with 40 years of experience in communications networking is available to 3M's customers and partners.

Whatever your telecommunication- and data network needs, from small LAN to campus-wide networks, from analog voice to digital data at 10Gbps, 3M's innovative systems offer efficient, reliable and cost-effective solutions. Our portfolio is grouped into three segments:

- **Volition™ Network Solutions**
- **Fibre Interconnect Solutions**
- **Copper Interconnect Solutions**

Volition™ Network Solutions feature copper and fibre interconnects, patchcords, horizontal and backbone cables for indoor and outdoor applications, and enabling electronic equipment.

The Fibre Interconnect Solutions portfolio includes an extensive line of ferruled fibre optic connectors, mechanical splices, cable assemblies and accessories.

The Copper Interconnect Solutions portfolio features a variety of cross-connect blocks with the appropriate distribution boxes and frames. It also features a range of telephone outlets.

Whether you are selecting products from just one of the segments or from all of them, they are all designed to enable you to build and operate efficient high-speed enterprise wide networks.

The components of 3M's Enterprise Network Solutions feature innovative and high performance designs that offer strong customer value.

Solutions for Enterprise Networks

Everything your Network needs

Volition™ Network Solutions

Volition Network Solutions feature a unique fibre cabling system providing “freedom of choice” in the design and optimisation of the overall network architecture. It also features a state of the art voice and data copper cabling system, including a Category 6 offering, providing “significant channel performance headroom” over existing standards and helping customers to migrate to higher bandwidth.

A variety of easy to install and innovative connectivity solutions ensuring high performance, and reliable systems form part of the offer. The revolutionary VF-45™ small form factor fibre connector has helped in reducing the complexity of fibre networking, while the 3M RJ 45 copper products offer simple termination solutions – jacks snap on without tools – with built-in reliability features and component performance exceeding existing standards.

Fibre Interconnect Solutions

3M Fibre Interconnect Solutions offer a complete line of singlemode and multimode ferruled fibre optic connectors including Hot Melt and Crimplok™ connectors in ST and SC style. To complement this, connectors are also available terminated as pigtails or patch cords in a variety of lengths. There is also an extensive range of mounting hardware and accessories including 19” patch panels and distribution boxes. The Fibrlok™ mechanical splice, available in single and multi-fibre versions for single mode and multimode fibre completes the offer.

Copper Interconnect Solutions

3M Copper Interconnect Solutions include an extensive line of insulation displacement connector (IDC) products for voice and data applications and a comprehensive portfolio of complimentary accessories including mounting frames, distribution boxes and installation tooling. All the products within this segment have gained industry acceptance and recognition for consistent performance and ease of termination.

Solutions for Enterprise Networks

Freedom in Network Design

In the conventional distributed structured cabling design, backbone cable is optical fibre, with the horizontal segment of the network typically comprised of twisted-pair copper cable or optical fibre cable. Backbone cables in an interbuilding network travel from a main cross-connect (Distributor) to one or more horizontal cross-connects within the telecommunication rooms on each floor, which includes active electronics equipment such as hubs, concentrators or switches.

Zone Distribution

Moves, adds or changes in an open-office environment can be accommodated quickly and efficiently through consolidation points by combining permanent feeder cabling with preterminated plug-and-play extender cables associated with the work area. Providing connectivity closer to end-users not only adds flexibility, but also reduces network down-time and recabling needs, which can result in significant cost savings.

Freedom in Network Design

Centralized Network

Optical fibre's unlimited bandwidth and ability to carry data over long distances is best utilized in centralized networks. These networks have more unblocked bandwidth than distributed networks and are therefore better suited for combined voice, video and data traffic requiring quality of service implementation. Optical fibre eliminates intermediate closets, thus simplifying network layout and reducing overall system cost. A centralized network is the most efficient and cost effective way to implement fibre-to-the-desk.

Comparison of Network Architectures

	Distributed Network		Zone Distribution	Centralized Network
Theoretical throughput	1 Gps	1 Gps	10 Gps	
Bandwidth scalability	possibly up to 2.5 Gps	possibly up to 10 Gps	> 10 Gps with OM-3/SM	
Network scalability cost	High	Med-High	Low	
QOS / Security	Low	Medium	High	
Maintenance	Difficult	Difficult	Easy	
Sensivity to environment	Low	Medium	High	
Moves and changes	Medium to difficult	Easy	Medium	
Initial investment	80	90	100	
Cost of ownership	100	90	80	

Distributed Network

Fibre in the Backbone

The transmission capability of fibre makes it the ideal choice for the backbone since this is where the traffic is concentrated. Additionally, the superior distance capability of fibre makes it the ideal choice for cross campus links between building distributors.

In the horizontal distribution, where traffic is less concentrated, Category 5e copper cabling meets all of today's requirements, adequately supporting transmission speeds up to 1Gbps. Looking to the future, the increased performance capability of the Category 6 system means that new applications are also likely to be supported thus providing a high level of confidence that the network will last for many years. Where there are special requirements relating to the operating environment (security requirements, electrical noise, need for long link lengths or high bandwidth etc.), the use of fibre throughout the network should be considered.

Zone Distribution

Fibre to the Zone

Extending fibre out into the horizontal distribution provides an economical alternative to installing fibre throughout the network. This architecture is particularly beneficial in situations where multiple users need network access and there are cable containment issues. It also provides a convenient upgrade path for high bandwidth applications. Typical examples of where this architecture would be of benefit would be conference rooms and classrooms. In such cases a simple un-managed switch would provide the copper/fibre conversion. Users would access the network using copper work area cords.

Centralized Network

Fibre to the desk (FTTD)

Although fibre has been used in the backbone for many years, wide-spread deployment has been less common even though its benefits and technical superiority have been widely accepted e.g.

- High bandwidth - up to 10Gbps on multimode fibre
- Immunity to interference - does not emit RFI is not susceptible to EMI
- Security - very difficult to tap into
- Small physical size - six-workstation fibre cable is the same diameter as a Category 5e copper cable
- Long distance capability - channel lengths much greater than 100m possible

Bandwidth and distance are probably the most important benefits and the network designer can leverage them to great advantage e.g.

- Implementation of centralized architecture
 - Eliminates Floor Distributors
 - Simplifies maintenance
- Formation of “switch farms” alongside “server farms”
 - Improves bandwidth, eliminates blocking

- Matching user/services/switch backplane performance
 - Maximises bandwidth delivered to the end user
- More efficient usage of equipment ports
 - More cost effective

If the network is properly designed, the network owner is not only guaranteed the best-installed performance, he is also assured that it will be usable in the future to support the most far reaching of applications.

	The examples that follow show three alternative ways of deploying a centralized network architecture
	• The home run: - fibre cable is pulled from the building distributor all the way to the telecommunications outlet • The home run with splice point: - as above but a splice is introduced to breakout the high fibre count backbone cable into two and four fibre horizontal cable • The passive floor distributor: - a passive cross connection point is retained and located in a floor distributor

Is a centralized network more expensive?

Simply comparing the cost of components will not reflect the true picture. As networks are designed to deliver a specified bandwidth to users irrespective of network usage, a good measure would be to compare the cost per Mbps delivered. 3M commissioned the Tolly Group to prepare a white paper¹ to com-

pare traditional distributed network costs to those of a centralized fibre network. The comparison was on a per-user basis. Using the same network designs and costs found in that white paper the cost per Mbps delivered for the two architectures based on 267 users is shown below.

	Cat 5e Distributed Network	Fibre Optic Centralized Network
	(16-port edge switches w/gigabit uplink)	
Cost per user	\$ 962.76	\$ 806.80
Cost for 267 users	\$ 257,056.92	\$ 215,415.60
Available bandwidth per user	62,5 Mbps	100 Mbps
Total bandwidth delivered	16688 Mbps	26700 Mbps
Cost per Mbps delivered	\$ 15.40	\$ 8.07

It can be seen that the centralized fibre network actually costs 48% less per delivered Mbps than the equivalent distributed network while at the same time delivering 160% of the bandwidth. It should be

noted that as the network bandwidths increase, the centralized fibre architecture becomes even cheaper per delivered Mbps.

Centralized Network Solutions

FTTD - The Home Run

The Home Run - two or four fibre horizontal cable serving the work area is pulled from the telecommunications outlet (TO) all the way back to the building distributor (BD). A modular insulation displacement connector (IDC) block is used to provide a flexibility point for the copper voice cables only, therefore eliminating the need for a floor distributor (FD). The block is mounted on a compact back mount frame that can be supplied in a variety of configurations (free standing, wall supported or wall mounted). The IDC block is useful for adding and removing services when required.

FTTD - The Home Run with Splice Point

Similar to the Home Run, in this architecture a splice is added to breakout high fibre count backbone cable originating at the building distributor (BD), into two or four fibre horizontal cable serving the work area.

FTTD - The Passive Floor Distributor

In this case a passive cross connection system installed in the floor distributor (FD) is used to provide a flexibility point for the fibre cables serving the work area, the copper voice cables are provided as in the previous two cases.
